

## INSTALLATION GUIDELINES

The male plug fits on the hall sensor harness and the female plug fits on the ignition module harness.

Slide the three wires from each end through the two large rubber protection grommets (different from the original design).

Slide the small red rubber grommet over each wire (direction is not important).

Lay each correctly coloured wire into the metal pins and bend over the clasps with a pair of pliers or crimping tool.

The male plug will require the male metal pins – these are fed in from the back and pulled through with needle nose pliers from the front of the plug – they will click into place and be retained by the small metal barbs.

The female plug will require the butterfly type pins – they will require you to push them in using the attached wire until it clicks into place.

Once all the pins are secure you then pull the rubber grommets over the back ends of the plugs

***\*\*PLEASE NOTE Many components require fitting skills that take years of experience to acquire. Incorrect fitting could cause accidents and/or personal danger. If you do not own the correct tools or the necessary experience then entrust the job to someone who is qualified.***
